

Project Scope and Preferred Project

1. First, write one paragraph that describes the problem that you have identified that you would like to work on.
 - College students usually lack organizational skills and often struggle at managing their time. Because of this, students constantly forget about important things like assignment due dates, study enough for exams, and appointment dates. This creates a problem for students since it directly affects their performance at school and eventually their grades.
2. Imagine what you would build (a web site? an app? an online service?) that could address the problem you described above.
 - If possible, want to build a cross-platform app (Android, iPhone and PC). This is because students tend to always have their phone with them, but the assignments are usually done in a PC. The phone app will organize the assignments for the student and notify whenever a due date is near. The student will then use the PC app to do the actual homework or study for an exam.
3. Complete a version of the product scope and value proposition exercises (from week four class sessions) on the imagined product or service.

Must Haves	Performance Benefits	Delighters
Access to Canvas A built-in calendar Notifications	A good GUI Cross-platform support App size	Color-coded classes Themes Built-in note editor Access to online drives Connect to email Access to camera

Value Proposition:

- Less organizing, better grades.

4. Define your project role.
 - Project Leader, Lead Designer, Lead Developer.
